

# Deep Generative Models: Discrete Latent Variables

Philip Schulz and Wilker Aziz

VI Tutorial @ Host  
[Site](#)

- 1 First Attempt: Wake-Sleep
- 2 Neural Variational Inference
- 3 Score function estimator
- 4 Variance reduction

# Generative Models

Joint distribution over observed data  $x$  and latent variables  $z$ .

$$p(x, z|\theta) = \underbrace{p(z)}_{\text{prior}} \underbrace{p(x|z, \theta)}_{\text{likelihood}}$$

The likelihood and prior are often standard distributions (Gaussian, Bernoulli) with simple dependence on conditioning information.

# Deep generative models

Joint distribution with **deep observation model**

$$p(x, z|\theta) = \underbrace{p(z)}_{\text{prior}} \underbrace{p(x|z, \theta)}_{\text{likelihood}}$$

mapping from  $z$  to  $p(x|z, \theta)$  is a NN with parameters  $\theta$

# Deep generative models

Joint distribution with **deep observation model**

$$p(x, z|\theta) = \underbrace{p(z)}_{\text{prior}} \underbrace{p(x|z, \theta)}_{\text{likelihood}}$$

mapping from  $z$  to  $p(x|z, \theta)$  is a NN with parameters  $\theta$

Marginal likelihood

$$p(x|\theta) = \int p(x, z|\theta) \, dz = \int p(z)p(x|z, \theta) \, dz$$

**intractable** in general

# Goals

We want

- richer probabilistic models

# Goals

We want

- richer probabilistic models
- complex observation models  
parameterised by NNs

# Goals

We want

- richer probabilistic models
- complex observation models  
parameterised by NNs

but we can't perform gradient-based MLE

# Goals

We want

- richer probabilistic models
- complex observation models  
parameterised by NNs

but we can't perform gradient-based MLE

We need **approximate inference** techniques!

# ELBO recap

And we've developed the ELBO

$$\log p(x) = \log \int p(z, x) dz$$

# ELBO recap

And we've developed the ELBO

$$\log p(x) = \log \int p(z, x) dz = \log \int q(z|x) \frac{p(z, x)}{q(z|x)} dz$$

# ELBO recap

And we've developed the ELBO

$$\begin{aligned}\log p(x) &= \log \int p(z, x) dz = \log \int q(z|x) \frac{p(z, x)}{q(z|x)} dz \\ &\stackrel{\text{JI}}{\geq} \underbrace{\mathbb{E}_{q(z|x)} \left[ \log \frac{p(z, x)}{q(z|x)} \right]}_{\text{ELBO}}\end{aligned}$$

# ELBO recap

And we've developed the ELBO

$$\log p(x) = \log \int p(z, x) dz = \log \int q(z|x) \frac{p(z, x)}{q(z|x)} dz$$

$$\stackrel{\text{JL}}{\geq} \underbrace{\mathbb{E}_{q(z|x)} \left[ \log \frac{p(z, x)}{q(z|x)} \right]}_{\text{ELBO}}$$

$$\begin{aligned} \text{ELBO} &= \mathbb{E}_{q(z|x)} \left[ \log \frac{p(z|x)p(x)}{q(z|x)} \right] \\ &= - \underbrace{\text{KL} (q(z|x) \parallel p(z|x))}_{\text{gap}} + \log p(x) \end{aligned}$$

- 1 First Attempt: Wake-Sleep
- 2 Neural Variational Inference
- 3 Score function estimator
- 4 Variance reduction

# Wake-sleep Algorithm

- Generalise latent variables to Neural Networks
- Train generative neural model
- Use variational inference! (kind of)

# Wake-sleep Architecture

2 Neural Networks:

# Wake-sleep Architecture

## 2 Neural Networks:

- A generation network to model the data (the one we want to optimise) – parameters:  $\theta$

# Wake-sleep Architecture

## 2 Neural Networks:

- A generation network to model the data (the one we want to optimise) – parameters:  $\theta$
- An inference (recognition) network (to model the latent variable) – parameters:  $\lambda$

# Wake-sleep Architecture

## 2 Neural Networks:

- A generation network to model the data (the one we want to optimise) – parameters:  $\theta$
- An inference (recognition) network (to model the latent variable) – parameters:  $\lambda$
- Original setting: binary hidden units

# Wake-sleep Architecture

## 2 Neural Networks:

- A generation network to model the data (the one we want to optimise) – parameters:  $\theta$
- An inference (recognition) network (to model the latent variable) – parameters:  $\lambda$
- Original setting: binary hidden units
- Training is performed in a “hard EM” fashion

# Generator

# Inference Network

# Wake-sleep Training

## Wake Phase

- Use inference network to sample hidden unit setting  $z$  from  $q(z|x, \lambda)$
- Update generation parameters  $\theta$  to maximize joint log-likelihood of data and latents  $p(x, z|\theta)$

# Wake-sleep Training

## Wake Phase

- Use inference network to sample hidden unit setting  $z$  from  $q(z|x, \lambda)$
- Update generation parameters  $\theta$  to maximize joint log-likelihood of data and latents  $p(x, z|\theta)$

## Sleep Phase

- Produce dream sample  $\tilde{x}$  from random hidden unit  $z$
- Update inference parameters  $\lambda$  to maximize probability of latent state  $q(z|\tilde{x}, \lambda)$

# Wake Phase Objective

## Objective

$$\begin{aligned} \arg \max_{\theta} \mathbb{E}_{p(x)} [\text{ELBO}(\theta, \lambda|x)] \\ = \arg \max_{\theta} \mathbb{E}_{p(x)} [\mathbb{E}_{q(z|x, \lambda)} [\log p(z, x|\theta)] + \mathbb{H}[q(z|x, \lambda)]] \end{aligned}$$

# Wake Phase Objective

## Objective

$$\begin{aligned} \arg \max_{\theta} \mathbb{E}_{p(x)} [\text{ELBO}(\theta, \lambda|x)] \\ = \arg \max_{\theta} \mathbb{E}_{p(x)} [\mathbb{E}_{q(z|x, \lambda)} [\log p(z, x|\theta)] + \mathbb{H}[q(z|x, \lambda)]] \end{aligned}$$

Gradient wrt  $\theta$  for  $x \sim p(x)$

$$\nabla_{\theta} \mathbb{E}_{q(z|x, \lambda)} [\log p(z, x|\theta)] + \nabla_{\theta} \mathbb{H}[q(z|x, \lambda)]$$

# Wake Phase Objective

## Objective

$$\begin{aligned} \arg \max_{\theta} \mathbb{E}_{p(x)} [\text{ELBO}(\theta, \lambda|x)] \\ = \arg \max_{\theta} \mathbb{E}_{p(x)} [\mathbb{E}_{q(z|x, \lambda)} [\log p(z, x|\theta)] + \mathbb{H}[q(z|x, \lambda)]] \end{aligned}$$

Gradient wrt  $\theta$  for  $x \sim p(x)$

$$\begin{aligned} \nabla_{\theta} \mathbb{E}_{q(z|x, \lambda)} [\log p(z, x|\theta)] + \nabla_{\theta} \mathbb{H}[q(z|x, \lambda)] \\ = \mathbb{E}_{q(z|x, \lambda)} [\nabla_{\theta} \log p(z, x|\theta)] \end{aligned}$$

# Wake Phase Objective

## Objective

$$\begin{aligned} \arg \max_{\theta} \mathbb{E}_{p(x)} [\text{ELBO}(\theta, \lambda|x)] \\ = \arg \max_{\theta} \mathbb{E}_{p(x)} [\mathbb{E}_{q(z|x, \lambda)} [\log p(z, x|\theta)] + \mathbb{H}[q(z|x, \lambda)]] \end{aligned}$$

Gradient wrt  $\theta$  for  $x \sim p(x)$

$$\begin{aligned} \nabla_{\theta} \mathbb{E}_{q(z|x, \lambda)} [\log p(z, x|\theta)] + \nabla_{\theta} \mathbb{H}[q(z|x, \lambda)] \\ = \mathbb{E}_{q(z|x, \lambda)} [\nabla_{\theta} \log p(z, x|\theta)] \\ \stackrel{\text{MC}}{\approx} \nabla_{\theta} \log p(z, x|\theta) \quad \text{where } z \sim q(z|x, \lambda) \end{aligned}$$

# Wake Phase Objective

Assumes  $z$  to be fixed random draw from  $q(z|x, \lambda)$   
and maximises  $\log p(z, x|\theta)$ .

This is simply supervised learning with imputed latent data!

# Wake Phase Sampling

Sampling  $z \sim q(z|x, \lambda)$

# Wake Phase Sampling

Sampling  $z \sim q(z|x, \lambda)$

# Wake Phase Sampling

Sampling  $z \sim q(z|x, \lambda)$

# Wake Phase Sampling

Sampling  $z \sim q(z|x, \lambda)$

# Wake Phase Update

Compute  $\log p(x, z|\theta)$  and update  $\theta$

# Sleep Phase Objective

Objective

$$\begin{aligned} & \arg \max_{\lambda} \mathbb{E}_{p(x)} [\text{ELBO}(\theta, \lambda|x)] \\ &= \arg \max_{\lambda} \mathbb{E}_{p(x)} [\mathbb{E}_{q(z|x, \lambda)} [\log p(z, x|\theta)] + \mathbb{H}[q(z|x, \lambda)]] \end{aligned}$$

# Sleep Phase Objective

Objective

$$\begin{aligned} \arg \max_{\lambda} \mathbb{E}_{p(x)} [\text{ELBO}(\theta, \lambda|x)] \\ = \arg \max_{\lambda} \mathbb{E}_{p(x)} [\mathbb{E}_{q(z|x, \lambda)} [\log p(z, x|\theta)] + \mathbb{H}[q(z|x, \lambda)]] \end{aligned}$$

Gradient wrt  $\lambda$  for  $x \sim p(x)$

$$\nabla_{\lambda} \mathbb{E}_{q(z|x, \lambda)} [\log p(z, x|\theta)] + \nabla_{\lambda} \mathbb{H}[q(z|x, \lambda)]$$

# Sleep Phase Objective

Objective

$$\begin{aligned} \arg \max_{\lambda} \mathbb{E}_{p(x)} [\text{ELBO}(\theta, \lambda|x)] \\ = \arg \max_{\lambda} \mathbb{E}_{p(x)} [\mathbb{E}_{q(z|x, \lambda)} [\log p(z, x|\theta)] + \mathbb{H}[q(z|x, \lambda)]] \end{aligned}$$

Gradient wrt  $\lambda$  for  $x \sim p(x)$

$$\nabla_{\lambda} \mathbb{E}_{q(z|x, \lambda)} [\log p(z, x|\theta)] + \nabla_{\lambda} \mathbb{H}[q(z|x, \lambda)]$$

Let's change the objective!

# Sleep Phase (Convenient) Objective

Flip the direction of the KL

$$\arg \min_{\lambda} \mathbb{E}_{p(x)} [\text{KL} (p(z|x, \theta) || q(z|x, \lambda))]$$

# Sleep Phase (Convenient) Objective

Flip the direction of the KL

$$\begin{aligned} & \arg \min_{\lambda} \mathbb{E}_{p(x)} [\text{KL} (p(z|x, \theta) || q(z|x, \lambda))] \\ &= \arg \min_{\lambda} \mathbb{E}_{p(x)} \mathbb{E}_{p(z|x, \theta)} [\log p(z|x, \theta) - \log q(z|x, \lambda)] \end{aligned}$$

# Sleep Phase (Convenient) Objective

Flip the direction of the KL

$$\begin{aligned}
 & \arg \min_{\lambda} \mathbb{E}_{p(x)} [\text{KL} (p(z|x, \theta) || q(z|x, \lambda))] \\
 &= \arg \min_{\lambda} \mathbb{E}_{p(x)} \mathbb{E}_{p(z|x, \theta)} [\log p(z|x, \theta) - \log q(z|x, \lambda)] \\
 &= \arg \max_{\lambda} \mathbb{E}_{p(x, z|\theta)} [\log q(z|x, \lambda)] - \underbrace{\mathbb{E}_{p(x, z|\theta)} [\log p(z|x, \theta)]}_{\text{constant}}
 \end{aligned}$$

# Sleep Phase (Convenient) Objective

Flip the direction of the KL

$$\begin{aligned}
 & \arg \min_{\lambda} \mathbb{E}_{p(x)} [\text{KL} (p(z|x, \theta) || q(z|x, \lambda))] \\
 &= \arg \min_{\lambda} \mathbb{E}_{p(x)} \mathbb{E}_{p(z|x, \theta)} [\log p(z|x, \theta) - \log q(z|x, \lambda)] \\
 &= \arg \max_{\lambda} \mathbb{E}_{p(x, z|\theta)} [\log q(z|x, \lambda)] - \underbrace{\mathbb{E}_{p(x, z|\theta)} [\log p(z|x, \theta)]}_{\text{constant}}
 \end{aligned}$$

Gradient wrt  $\lambda$

$$\nabla_{\lambda} \mathbb{E}_{p(x, z|\theta)} [\log q(z|x, \lambda)]$$

# Sleep Phase (Convenient) Objective

Flip the direction of the KL

$$\begin{aligned}
 & \arg \min_{\lambda} \mathbb{E}_{p(x)} [\text{KL} (p(z|x, \theta) \parallel q(z|x, \lambda))] \\
 &= \arg \min_{\lambda} \mathbb{E}_{p(x)} \mathbb{E}_{p(z|x, \theta)} [\log p(z|x, \theta) - \log q(z|x, \lambda)] \\
 &= \arg \max_{\lambda} \mathbb{E}_{p(x, z|\theta)} [\log q(z|x, \lambda)] - \underbrace{\mathbb{E}_{p(x, z|\theta)} [\log p(z|x, \theta)]}_{\text{constant}}
 \end{aligned}$$

Gradient wrt  $\lambda$

$$\begin{aligned}
 & \nabla_{\lambda} \mathbb{E}_{p(x, z|\theta)} [\log q(z|x, \lambda)] \\
 &= \mathbb{E}_{p(x, z|\theta)} [\nabla_{\lambda} \log q(z|x, \lambda)]
 \end{aligned}$$

# Sleep Phase (Convenient) Objective

Flip the direction of the KL

$$\begin{aligned}
 & \arg \min_{\lambda} \mathbb{E}_{p(x)} [\text{KL} (p(z|x, \theta) \parallel q(z|x, \lambda))] \\
 &= \arg \min_{\lambda} \mathbb{E}_{p(x)} \mathbb{E}_{p(z|x, \theta)} [\log p(z|x, \theta) - \log q(z|x, \lambda)] \\
 &= \arg \max_{\lambda} \mathbb{E}_{p(x, z|\theta)} [\log q(z|x, \lambda)] - \underbrace{\mathbb{E}_{p(x, z|\theta)} [\log p(z|x, \theta)]}_{\text{constant}}
 \end{aligned}$$

Gradient wrt  $\lambda$

$$\begin{aligned}
 & \nabla_{\lambda} \mathbb{E}_{p(x, z|\theta)} [\log q(z|x, \lambda)] \\
 &= \mathbb{E}_{p(x, z|\theta)} [\nabla_{\lambda} \log q(z|x, \lambda)] \\
 &\stackrel{\text{MC}}{\approx} \nabla_{\lambda} \log q(z|\tilde{x}, \lambda) \quad \text{where } z \sim p(z|\theta)
 \end{aligned}$$

$$\tilde{x} \sim p(x|z, \theta)$$

# Sleep Phase (Convenient) Objective

Assumes **fake data**  $\tilde{x}$  and latent variables  $z$  to be fixed random draws from  $p(x, z|\theta)$  via

$$z \sim p(z|\theta)$$

$$\tilde{x} \sim p(x|z, \theta)$$

and maximises  $\log q(z|\tilde{x}, \lambda)$ .

# Sleep Phase Sampling

Sampling  $(z, \tilde{x}) \sim p(x, z|\theta)$

# Sleep Phase Sampling

Sampling  $(z, \tilde{x}) \sim p(x, z|\theta)$

# Sleep Phase Sampling

Sampling  $(z, \tilde{x}) \sim p(x, z|\theta)$

# Sleep Phase Update

Compute  $\log q(z|\tilde{x}, \lambda)$  and update  $\lambda$

# Wake-sleep Algorithm

## Advantages

- Simple layer-wise updates
- Amortised inference: all latent variables are inferred from the same weights  $\lambda$

# Wake-sleep Algorithm

## Advantages

- Simple layer-wise updates
- Amortised inference: all latent variables are inferred from the same weights  $\lambda$

## Drawbacks

- Inference and generative networks are trained on different objectives
- Inference weights  $\lambda$  are updated on fake data  $\tilde{x}$
- Generative weights are bad initially, giving wrong signal to the updates of  $\lambda$

- 1 First Attempt: Wake-Sleep
- 2 Neural Variational Inference**
- 3 Score function estimator
- 4 Variance reduction

# Variational Inference Learning (NVIL)

Generative model with NN likelihood

# Variational Inference Learning (NVIL)

Generative model with NN likelihood

Let us consider a latent factor model for topic modelling:

# Variational Inference Learning (NVIL)

Generative model with NN likelihood

Let us consider a latent factor model for topic modelling:

- a document  $x = (x_1, \dots, x_N)$  consists of  $n$  i.i.d. categorical draws from that model

# Variational Inference Learning (NVIL)

Generative model with NN likelihood

Let us consider a latent factor model for topic modelling:

- a document  $x = (x_1, \dots, x_N)$  consists of  $n$  i.i.d. categorical draws from that model
- the categorical distribution in turn depends on binary latent factors  $z = (z_1, \dots, z_K)$  which are also i.i.d.

# Latent factor model

$$Z_j \sim \text{Bernoulli}(\alpha) \quad (1 \leq k \leq K)$$

$$X_i|z \sim \text{Categorical}(f(z; \theta)) \quad (1 \leq i \leq N)$$

Here  $0 < \alpha < 1$  specifies a Bernoulli prior  
and  $f(\cdot; \theta)$  is a function computed by a  
neural network with softmax output, e.g.

$$f(z; \theta) = \text{softmax}(Wz + b)$$
$$\theta = \{W, b\}$$

# Example Model

Joint distribution: independent latent variables

# Example Model

Posterior: latent variables are marginally dependent.

For our variational distribution we are going to assume that they are not (recall: mean field assumption).

# Mean Field Inference

The inference network needs to predict  $K$  Bernoulli parameters  $b_1^K$ . Any neural network with sigmoid output will do that job.

# Inference Network

$$q(z|x, \lambda) = \prod_{k=1}^K \text{Bern}(z_k | b_k)$$

where  $b_1^K = g(x; \lambda)$

Example architecture

$$h = \frac{1}{N} \sum_{i=1}^N E_{x_i} \quad b_1^K = \text{sigmoid}(Mh + c)$$

$$\lambda = \{E, M, c\}$$

# Objective

$$\text{ELBO} = \mathbb{E}_{q(z|x, \lambda)} [\log p(x, z|\theta)] + \mathbb{H}(q(z|x, \lambda))$$

# Objective

$$\begin{aligned}\text{ELBO} &= \mathbb{E}_{q(z|x, \lambda)} [\log p(x, z|\theta)] + \mathbb{H}(q(z|x, \lambda)) \\ &= \mathbb{E}_{q(z|x, \lambda)} [\log p(x|z, \theta)] - \text{KL}(q(z|x, \lambda) \parallel p(z))\end{aligned}$$

# Objective

$$\begin{aligned}\text{ELBO} &= \mathbb{E}_{q(z|x, \lambda)} [\log p(x, z|\theta)] + \mathbb{H}(q(z|x, \lambda)) \\ &= \mathbb{E}_{q(z|x, \lambda)} [\log p(x|z, \theta)] - \text{KL}(q(z|x, \lambda) \parallel p(z))\end{aligned}$$

Parameter estimation

$$\arg \max_{\theta, \lambda} \mathbb{E}_{q(z|x, \lambda)} [\log p(x|z, \theta)] - \text{KL}(q(z|x, \lambda) \parallel p(z))$$

## KL

KL between  $K$  independent Bernoulli distributions is tractable

$$\text{KL}(q(z|x, \lambda) \parallel p(z|\alpha)) = \sum_{k=1}^K \text{KL}(q(z_k|x, \lambda) \parallel p(z_k|\alpha))$$

## KL

KL between  $K$  independent Bernoulli distributions is tractable

$$\begin{aligned}\text{KL}(q(z|x, \lambda) \parallel p(z|\alpha)) &= \sum_{k=1}^K \text{KL}(q(z_k|x, \lambda) \parallel p(z_k|\alpha)) \\ &= \sum_{k=1}^K \text{KL}(\text{Bernoulli}(b_k) \parallel \text{Bernoulli}(\alpha))\end{aligned}$$

## KL

KL between  $K$  independent Bernoulli distributions is tractable

$$\begin{aligned}\text{KL}(q(z|x, \lambda) \parallel p(z|\alpha)) &= \sum_{k=1}^K \text{KL}(q(z_k|x, \lambda) \parallel p(z_k|\alpha)) \\ &= \sum_{k=1}^K \text{KL}(\text{Bernoulli}(b_k) \parallel \text{Bernoulli}(\alpha)) \\ &= \sum_{k=1}^K b_k \log \frac{b_k}{\alpha} + (1 - b_k) \log \frac{1 - b_k}{1 - \alpha}\end{aligned}$$

# Generative Network Gradient

$$\frac{\partial}{\partial \theta} \left( \mathbb{E}_{q(z|x, \lambda)} [\log p(x|z, \theta)] - \overbrace{\text{KL}(q(z|x, \lambda) || p(z))}^{\text{constant wrt } \theta} \right)$$

# Generative Network Gradient

$$\begin{aligned}
 & \frac{\partial}{\partial \theta} \left( \mathbb{E}_{q(z|x, \lambda)} [\log p(x|z, \theta)] - \overbrace{\text{KL}(q(z|x, \lambda) || p(z))}^{\text{constant wrt } \theta} \right) \\
 &= \underbrace{\mathbb{E}_{q(z|x, \lambda)} \left[ \frac{\partial}{\partial \theta} \log p(x|z, \theta) \right]}_{\text{expected gradient :)}}
 \end{aligned}$$

# Generative Network Gradient

$$\begin{aligned}
 & \frac{\partial}{\partial \theta} \left( \mathbb{E}_{q(z|x, \lambda)} [\log p(x|z, \theta)] - \overbrace{\text{KL}(q(z|x, \lambda) || p(z))}^{\text{constant wrt } \theta} \right) \\
 &= \underbrace{\mathbb{E}_{q(z|x, \lambda)} \left[ \frac{\partial}{\partial \theta} \log p(x|z, \theta) \right]}_{\text{expected gradient :)}} \\
 &\stackrel{\text{MC}}{\approx} \frac{1}{S} \sum_{s=1}^S \frac{\partial}{\partial \theta} \log p(x|z^{(s)}, \theta) \quad \text{where } z^{(s)} \sim q(z|x, \lambda)
 \end{aligned}$$

# Inference Network Gradient

$$\frac{\partial}{\partial \lambda} \left( \mathbb{E}_{q(z|x, \lambda)} [\log p(x|z, \theta)] - \overbrace{\text{KL} (q(z|x, \lambda) || p(z))}^{\text{analytical}} \right)$$

# Inference Network Gradient

$$\begin{aligned}
 & \frac{\partial}{\partial \lambda} \left( \mathbb{E}_{q(z|x, \lambda)} [\log p(x|z, \theta)] - \overbrace{\text{KL}(q(z|x, \lambda) || p(z))}^{\text{analytical}} \right) \\
 &= \frac{\partial}{\partial \lambda} \mathbb{E}_{q(z|x, \lambda)} [\log p(x|z, \theta)] - \underbrace{\frac{\partial}{\partial \lambda} \text{KL}(q(z|x, \lambda) || p(z))}_{\text{analytical computation}}
 \end{aligned}$$

# Inference Network Gradient

$$\begin{aligned}
 & \frac{\partial}{\partial \lambda} \left( \mathbb{E}_{q(z|x, \lambda)} [\log p(x|z, \theta)] - \overbrace{\text{KL}(q(z|x, \lambda) || p(z))}^{\text{analytical}} \right) \\
 &= \frac{\partial}{\partial \lambda} \mathbb{E}_{q(z|x, \lambda)} [\log p(x|z, \theta)] - \underbrace{\frac{\partial}{\partial \lambda} \text{KL}(q(z|x, \lambda) || p(z))}_{\text{analytical computation}}
 \end{aligned}$$

The first term again requires approximation by sampling, but there is a problem

# Inference Network Gradient

$$\frac{\partial}{\partial \lambda} \mathbb{E}_{q_{\lambda}(z|x)} [\log p_{\theta}(x|z)]$$

# Inference Network Gradient

$$\begin{aligned} & \frac{\partial}{\partial \lambda} \mathbb{E}_{q_{\lambda}(z|x)} [\log p_{\theta}(x|z)] \\ &= \frac{\partial}{\partial \lambda} \sum_z q(z|x, \lambda) \log p(x|z, \theta) \end{aligned}$$

# Inference Network Gradient

$$\begin{aligned}
 & \frac{\partial}{\partial \lambda} \mathbb{E}_{q_{\lambda}(z|x)} [\log p_{\theta}(x|z)] \\
 &= \frac{\partial}{\partial \lambda} \sum_z q(z|x, \lambda) \log p(x|z, \theta) \\
 &= \underbrace{\sum_z \frac{\partial}{\partial \lambda} (q(z|x, \lambda)) \log p(x|z, \theta)}_{\text{not an expectation}}
 \end{aligned}$$

# Inference Network Gradient

$$\begin{aligned}
 & \frac{\partial}{\partial \lambda} \mathbb{E}_{q_{\lambda}(z|x)} [\log p_{\theta}(x|z)] \\
 &= \frac{\partial}{\partial \lambda} \sum_z q(z|x, \lambda) \log p(x|z, \theta) \\
 &= \underbrace{\sum_z \frac{\partial}{\partial \lambda} (q(z|x, \lambda)) \log p(x|z, \theta)}_{\text{not an expectation}}
 \end{aligned}$$

- MC estimator is non-differentiable

# Inference Network Gradient

$$\begin{aligned}
 & \frac{\partial}{\partial \lambda} \mathbb{E}_{q_{\lambda}(z|x)} [\log p_{\theta}(x|z)] \\
 &= \frac{\partial}{\partial \lambda} \sum_z q(z|x, \lambda) \log p(x|z, \theta) \\
 &= \underbrace{\sum_z \frac{\partial}{\partial \lambda} (q(z|x, \lambda)) \log p(x|z, \theta)}_{\text{not an expectation}}
 \end{aligned}$$

- MC estimator is non-differentiable
- Differentiating the expression does not yield an expectation: cannot approximate via MC

# Score function estimator

We can again use the log identity for derivatives

$$\begin{aligned} & \frac{\partial}{\partial \lambda} \mathbb{E}_{q_{\lambda}(z|x)} [\log p_{\theta}(x|z)] \\ &= \sum_z \frac{\partial}{\partial \lambda} (q(z|x, \lambda)) \log p(x|z, \theta) \end{aligned}$$

# Score function estimator

We can again use the log identity for derivatives

$$\begin{aligned}
 & \frac{\partial}{\partial \lambda} \mathbb{E}_{q_{\lambda}(z|x)} [\log p_{\theta}(x|z)] \\
 &= \sum_z \frac{\partial}{\partial \lambda} (q(z|x, \lambda)) \log p(x|z, \theta) \\
 &= \sum_z q(z|x, \lambda) \frac{\partial}{\partial \lambda} (\log q(z|x, \lambda)) \log p(x|z, \theta)
 \end{aligned}$$

# Score function estimator

We can again use the log identity for derivatives

$$\begin{aligned}
 & \frac{\partial}{\partial \lambda} \mathbb{E}_{q_{\lambda}(z|x)} [\log p_{\theta}(x|z)] \\
 &= \sum_z \frac{\partial}{\partial \lambda} (q(z|x, \lambda)) \log p(x|z, \theta) \\
 &= \sum_z q(z|x, \lambda) \frac{\partial}{\partial \lambda} (\log q(z|x, \lambda)) \log p(x|z, \theta) \\
 &= \underbrace{\mathbb{E}_{q(z|x, \lambda)} \left[ \log p(x|z, \theta) \frac{\partial}{\partial \lambda} \log q(z|x, \lambda) \right]}_{\text{expected gradient :)}}
 \end{aligned}$$

# Score function estimator: remarks

We can now build an MC estimator

$$\begin{aligned} & \frac{\partial}{\partial \lambda} \mathbb{E}_{q(z|x, \lambda)} [\log p(x|z, \theta)] \\ &= \mathbb{E}_{q(z|x, \lambda)} \left[ \log p(x|z, \theta) \frac{\partial}{\partial \lambda} \log q(z|x, \lambda) \right] \end{aligned}$$

# Score function estimator: remarks

We can now build an MC estimator

$$\begin{aligned}
 & \frac{\partial}{\partial \lambda} \mathbb{E}_{q(z|x, \lambda)} [\log p(x|z, \theta)] \\
 &= \mathbb{E}_{q(z|x, \lambda)} \left[ \log p(x|z, \theta) \frac{\partial}{\partial \lambda} \log q(z|x, \lambda) \right] \\
 &\stackrel{\text{MC}}{\approx} \frac{1}{S} \sum_{s=1}^S \log p(x|z^{(s)}, \theta) \frac{\partial}{\partial \lambda} \log q(z^{(s)}|x, \lambda)
 \end{aligned}$$

where  $z^{(s)} \sim q(z|x, \lambda)$

# Score function estimator: remarks

We can now build an MC estimator

$$\begin{aligned}
 & \frac{\partial}{\partial \lambda} \mathbb{E}_{q(z|x, \lambda)} [\log p(x|z, \theta)] \\
 &= \mathbb{E}_{q(z|x, \lambda)} \left[ \log p(x|z, \theta) \frac{\partial}{\partial \lambda} \log q(z|x, \lambda) \right] \\
 &\stackrel{\text{MC}}{\approx} \frac{1}{S} \sum_{s=1}^S \log p(x|z^{(s)}, \theta) \frac{\partial}{\partial \lambda} \log q(z^{(s)}|x, \lambda)
 \end{aligned}$$

where  $z^{(s)} \sim q(z|x, \lambda)$

- magnitude of  $\log p(x|z, \theta)$  varies widely

# Score function estimator: remarks

We can now build an MC estimator

$$\begin{aligned}
 & \frac{\partial}{\partial \lambda} \mathbb{E}_{q(z|x, \lambda)} [\log p(x|z, \theta)] \\
 &= \mathbb{E}_{q(z|x, \lambda)} \left[ \log p(x|z, \theta) \frac{\partial}{\partial \lambda} \log q(z|x, \lambda) \right] \\
 &\stackrel{\text{MC}}{\approx} \frac{1}{S} \sum_{s=1}^S \log p(x|z^{(s)}, \theta) \frac{\partial}{\partial \lambda} \log q(z^{(s)}|x, \lambda)
 \end{aligned}$$

where  $z^{(s)} \sim q(z|x, \lambda)$

- magnitude of  $\log p(x|z, \theta)$  varies widely
- model likelihood does not contribute to direction of gradient

# Pros and Cons

- Pros
  - Applicable to all distributions
  - Many libraries come with samplers for common distributions

# Pros and Cons

- Pros
  - Applicable to all distributions
  - Many libraries come with samplers for common distributions
- Cons
  - High Variance!

- 1 First Attempt: Wake-Sleep
- 2 Neural Variational Inference
- 3 Score function estimator
- 4 Variance reduction**

# When variance is high we can

# When variance is high we can

- sample more

# When variance is high we can

- sample more
- use variance reduction techniques (e.g. baselines and control variates)

# Control variates

## Intuition

To estimate  $\mathbb{E}[f(z)]$  via Monte Carlo we compute the empirical average of  $\hat{f}(z)$  where  $\hat{f}(z)$  is chosen so that  $\mathbb{E}[\hat{f}(z)] = \mathbb{E}[f(z)]$  and  $\text{Var}(f) > \text{Var}(\hat{f})$ .

# Equivalent expectations

Let  $\bar{f} = \mathbb{E}[f(z)]$  be an expectation of interest

# Equivalent expectations

Let  $\bar{f} = \mathbb{E}[f(z)]$  be an expectation of interest

- say we know  $\bar{c} = \mathbb{E}[c(z)]$

# Equivalent expectations

Let  $\bar{f} = \mathbb{E}[f(z)]$  be an expectation of interest

- say we know  $\bar{c} = \mathbb{E}[c(z)]$
- then for  $\hat{f}(z) \triangleq f(z) - b(c(z) - \mathbb{E}[c(z)])$

# Equivalent expectations

Let  $\bar{f} = \mathbb{E}[f(z)]$  be an expectation of interest

- say we know  $\bar{c} = \mathbb{E}[c(z)]$
- then for  $\hat{f}(z) \triangleq f(z) - b(c(z) - \mathbb{E}[c(z)])$   
it holds that  $\mathbb{E}[\hat{f}(z)] = \mathbb{E}[f(z)]$

# Equivalent expectations

Let  $\bar{f} = \mathbb{E}[f(z)]$  be an expectation of interest

- say we know  $\bar{c} = \mathbb{E}[c(z)]$
- then for  $\hat{f}(z) \triangleq f(z) - b(c(z) - \mathbb{E}[c(z)])$   
it holds that  $\mathbb{E}[\hat{f}(z)] = \mathbb{E}[f(z)]$
- and  $\text{Var}(\hat{f}) = \text{Var}(f) - 2b \text{Cov}(f, c) + b^2 \text{Var}(c)$

# Choosing the control variate

$$① \quad \hat{f}(z) \triangleq f(z) - b(c(z) - \mathbb{E}[c(z)])$$

$$② \quad \text{Var}(\hat{f}) = \text{Var}(f) - 2b \text{Cov}(f, c) + b^2 \text{Var}(c)$$

How do we choose  $b$  and  $c(z)$ ?

# Choosing the control variate

- 1  $\hat{f}(z) \triangleq f(z) - b(c(z) - \mathbb{E}[c(z)])$
- 2  $\text{Var}(\hat{f}) = \text{Var}(f) - 2b \text{Cov}(f, c) + b^2 \text{Var}(c)$

How do we choose  $b$  and  $c(z)$ ?

- If  $f(z)$  and  $c(z)$  are positively correlated, then we may reduce variance

# Choosing the control variate

- 1  $\hat{f}(z) \triangleq f(z) - b(c(z) - \mathbb{E}[c(z)])$
- 2  $\text{Var}(\hat{f}) = \text{Var}(f) - 2b \text{Cov}(f, c) + b^2 \text{Var}(c)$

How do we choose  $b$  and  $c(z)$ ?

- If  $f(z)$  and  $c(z)$  are positively correlated, then we may reduce variance
- solving  $\frac{\partial}{\partial b} \text{Var}(\hat{f}) = 0$

# Choosing the control variate

- 1  $\hat{f}(z) \triangleq f(z) - b(c(z) - \mathbb{E}[c(z)])$
- 2  $\text{Var}(\hat{f}) = \text{Var}(f) - 2b \text{Cov}(f, c) + b^2 \text{Var}(c)$

How do we choose  $b$  and  $c(z)$ ?

- If  $f(z)$  and  $c(z)$  are positively correlated, then we may reduce variance
- solving  $\frac{\partial}{\partial b} \text{Var}(\hat{f}) = 0$  yields  $b^* = \text{Cov}(f, c) / \text{Var}(c)$

# Choosing the control variate

- 1  $\hat{f}(z) \triangleq f(z) - b(c(z) - \mathbb{E}[c(z)])$
- 2  $\text{Var}(\hat{f}) = \text{Var}(f) - 2b \text{Cov}(f, c) + b^2 \text{Var}(c)$

How do we choose  $b$  and  $c(z)$ ?

- If  $f(z)$  and  $c(z)$  are positively correlated, then we may reduce variance
- solving  $\frac{\partial}{\partial b} \text{Var}(\hat{f}) = 0$  yields  $b^* = \text{Cov}(f, c) / \text{Var}(c)$

Of course,  $\mathbb{E}[c(z)]$  must be known!

# MC

We then use the estimate

$$\bar{f} \stackrel{\text{MC}}{\approx} \frac{1}{S} \left( \sum_{s=1}^S f(z^{(s)}) - bc(z^{(s)}) \right) + b\bar{c}$$

# MC

We then use the estimate

$$\bar{f} \stackrel{\text{MC}}{\approx} \frac{1}{S} \left( \sum_{s=1}^S f(z^{(s)}) - bc(z^{(s)}) \right) + b\bar{c}$$

And recall that for us

$$f(z) = \log p(x|z, \theta) \frac{\partial}{\partial \lambda} \log q(z|x, \lambda)$$

and  $z^{(s)} \sim q(z|x, \lambda)$

# Expected score

The Expectation of the score function is 0.

$$\mathbb{E}_{q(z|x, \lambda)} \left[ \frac{\partial}{\partial \lambda} \log q(z|x, \lambda) \right]$$

# Expected score

The Expectation of the score function is 0.

$$\begin{aligned} & \mathbb{E}_{q(z|x, \lambda)} \left[ \frac{\partial}{\partial \lambda} \log q(z|x, \lambda) \right] \\ &= \int q(z|x, \lambda) \frac{\partial}{\partial \lambda} \log q(z|x, \lambda) dz \end{aligned}$$

# Expected score

The Expectation of the score function is 0.

$$\begin{aligned}\mathbb{E}_{q(z|x, \lambda)} \left[ \frac{\partial}{\partial \lambda} \log q(z|x, \lambda) \right] \\&= \int q(z|x, \lambda) \frac{\partial}{\partial \lambda} \log q(z|x, \lambda) dz \\&= \int \frac{\partial}{\partial \lambda} q(z|x, \lambda) dz\end{aligned}$$

# Expected score

The Expectation of the score function is 0.

$$\begin{aligned} & \mathbb{E}_{q(z|x, \lambda)} \left[ \frac{\partial}{\partial \lambda} \log q(z|x, \lambda) \right] \\ &= \int q(z|x, \lambda) \frac{\partial}{\partial \lambda} \log q(z|x, \lambda) dz \\ &= \int \frac{\partial}{\partial \lambda} q(z|x, \lambda) dz \\ &= \frac{\partial}{\partial \lambda} \int q(z|x, \lambda) dz \end{aligned}$$

# Expected score

The Expectation of the score function is 0.

$$\begin{aligned} & \mathbb{E}_{q(z|x, \lambda)} \left[ \frac{\partial}{\partial \lambda} \log q(z|x, \lambda) \right] \\ &= \int q(z|x, \lambda) \frac{\partial}{\partial \lambda} \log q(z|x, \lambda) dz \\ &= \int \frac{\partial}{\partial \lambda} q(z|x, \lambda) dz \\ &= \frac{\partial}{\partial \lambda} \int q(z|x, \lambda) dz \\ &= \frac{\partial}{\partial \lambda} 1 = 0 \end{aligned}$$

# Baselines

With

$$f(z) = \log p(x|z, \theta) \frac{\partial}{\partial \lambda} \log q(z|x, \lambda)$$

and

$$c(z) = \frac{\partial}{\partial \lambda} \log q(z|x, \lambda)$$

we have

$$\hat{f}(z) =$$

# Baselines

With

$$f(z) = \log p(x|z, \theta) \frac{\partial}{\partial \lambda} \log q(z|x, \lambda)$$

and

$$c(z) = \frac{\partial}{\partial \lambda} \log q(z|x, \lambda)$$

we have

$$\hat{f}(z) = (\log p(x|z, \theta) - b) \frac{\partial}{\partial \lambda} \log q(z|x, \lambda)$$

# Baselines

With

$$f(z) = \log p(x|z, \theta) \frac{\partial}{\partial \lambda} \log q(z|x, \lambda)$$

and

$$c(z) = \frac{\partial}{\partial \lambda} \log q(z|x, \lambda)$$

we have

$$\hat{f}(z) = (\log p(x|z, \theta) - b) \frac{\partial}{\partial \lambda} \log q(z|x, \lambda)$$

$b$  is known as *baseline* in RL literature.

# Examples of baselines

- Moving average of  $\log p(x|z, \theta)$  based on previous batches

# Examples of baselines

- Moving average of  $\log p(x|z, \theta)$  based on previous batches
- A trainable constant  $b$

# Examples of baselines

- Moving average of  $\log p(x|z, \theta)$  based on previous batches
- A trainable constant  $b$
- A neural network prediction based on  $x$  e.g.  $b(x; \omega)$

# Examples of baselines

- Moving average of  $\log p(x|z, \theta)$  based on previous batches
- A trainable constant  $b$
- A neural network prediction based on  $x$  e.g.  $b(x; \omega)$
- The likelihood assessed at a deterministic point, e.g.  $b(x) = \log p(x|z^*, \theta)$  where  $z^* = \arg \max_z q(z|x, \lambda)$

# Trainable baselines

Baselines are predicted by a regression model (e.g. a neural net).

The model is trained using an  $L_2$ -loss.

$$\min_{\omega} (b(x; \omega) - \log p(x|z, \theta))^2$$

# Summary

- Wake-Sleep: train inference and generation networks with separate objectives

# Summary

- Wake-Sleep: train inference and generation networks with separate objectives
- NVIL: a single objective (ELBO) for both models

# Summary

- Wake-Sleep: train inference and generation networks with separate objectives
- NVIL: a single objective (ELBO) for both models
- Use score function estimator

# Summary

- Wake-Sleep: train inference and generation networks with separate objectives
- NVIL: a single objective (ELBO) for both models
- Use score function estimator
- Always use baselines for variance reduction!

# Implementation

Check one of our notebooks, e.g.

- inducing rationales for sentiment classification
